Hutzell, Paula rush search

Imp rtance:

Hi Paula,

Could you please authorize the following rush search?

Thanks, Jennifer

STIC:

Please search SEQ ID NOs: 4, 6, 8, and 10 from 09/865,159 in pending and commercial databases.

Thanks,

/ Jennifer Graser

## ALIGNMENTS

Exemplary truncated P. aeruginosa PAK pilin protein

14-MAR-2000 (first entry)

AAY44376;

AAY44376 standard; Protein; 123

Ą

Modified PAK pilin protein; alpha-helical forming portion; Pseudomonas infection; cystic fibrosis; neutropenia. WPI; 2000-106013/09. N-PSDB; AAZ29535. 11-JUN-1999; WO9965511-A2 Pseudomonas aeruginosa Hodges RS, Irvin RT; (UYAL-) UNIV ALBERTA. 12-JUN-1998; 23-DEC-1999. 98US-0089155. 99WO-CA00554.

Claim 9; Fig 1B; 32pp; English.

The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil modiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11-JUN-1999;

The present sequence encodes E coil truncated PAK pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide reg. is replaced by a peptide segment capable of forming a coiled-coil

peptide region

The present sequence is the H coil truncated PAK pilin protein from P, aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodimer with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and

                                                                                                                                                                                                                                                                                 Pseudomonas aeruginosa
                                                                                                                                                                                                                                                                                                                                           P. aeruginosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic
                                                                                                                                                                                                                                                                                                                                                              14-MAR-2000

                                                                    The present sequence is the modified PAO pilin protein from F.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prophylaxis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                            The present sequence encodes E coil truncated PAO pilin protein from p.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Beaudomonas infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                          The present sequence is the H coil truncated PAO pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil structures. These proteins are less inflammatory due to reduced degree combilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic
                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                            Composition for treating or preventing Pseudomonas aeruginosa infection comprising pilin protein that can not self-assemble - \,

                The present sequence is the modified KB7 pilin protein from P. aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil modiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.

The N-terminal 1-28 residues are deleted from K122 strain pilin protein. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The first five amino acid residues are not native to the K122 sequence, but are derived from an intrinsic coding sequence of the expression vector. The C-terminal residue is the Pro residue immediately upstream of the stop OCH codons. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.

XX X X X X
prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis
                                                                                                                                                                                                       The present sequence is the modified P1 pilin protein from P.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are
                                                                                                                                                                                                                                                                                  Claim 9; Fig 1D; 32pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-MAR-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes E coil truncated K122 pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY44382;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY44382 standard;

The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodimer with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pediadomonas infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

It is capable of eliciting antibodies (Abs) which bind to whole pili of type IV bacteria. The abblity of the submolecular unit to produce Abs which bind to whole pili provides the basis for vaccines against type IV bacterial infections, e.g. footrot infection in ruminants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antigenic preparation - stimulates production of antibodies binding to pilin protein of type IV piliated bacteria, useful in vaccine compsn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Key

This sequence is the C-terminal amino acid sequence of pilin from the P.aeruginosa strain PAK (Lys-to-Arg mutation), one of 10 strains which were investigated. The Rys-to-Arg mutation) peptide is classified in a group with C-terminal peptides containing 14 residues from Cys to Cys and is cross-reactive with surface peptides in certain bacteria and fungi. The peptides bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR25828 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 18; Page 27; 44pp; English

                                                                                                                                                               This sequence is the C-terminal amino acid sequence of pilin from the P.aeruginosa strain PAK, one of 10 strains which were investigated. The PAK peptide is classified in a group with C-terminal peptides containing 14 residues from Cys to Cys and is cross-reactive with surface peptides in certain bacteria and fungion the peptides bind specifically to pulmonary epithelial cells.                                                                                                                                                                                                                                                             This sequence represents the antigen which is bound by the monoclonal antibody (MAb) PK99H. This peptide corresponds to a region of the C-terminal receptor binding domain of the PAK pilin protein. The peptides given in AAR97576-80 are members of combinatorial library sets which were screened for their ability to inhibit the interaction of PK99H with this antigen. The peptides given in AAR97576-79 showed a large inhibitory effect, whereas the peptides were prepared using the method of the invention which identifies optimum subunits for each position. This means that the number of permutation oligomers which have to be synthesised and tested for optimal activity is fairly low.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hodges RS,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                             596

"Comparison of NMR solution structures of the receptor binding domains of Pseudomonas aeruginosa pili strains PAO, KB7, and PAK: implications for receptor binding and synthetic vaccine design.";

Biochemistry 34:16255-16268(1995).

1- SUBUNIT: THE FILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4

NANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGED LENGTH; THEY CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRAGED IN A HELICAL CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.

1- SIMILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.

SUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4

NANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY
CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL
CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.

SIMILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.

Microbiol. 5:543-560(1991)
SUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4
NANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY
CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL
CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.
SIMILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.
                                                                                                                     a.

B-cell Immun. 62:371-376(1994).

-i- SUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4

NANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.

-i- SIMILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.
